

JIRA MISC CUSTOM FIELDS

for Jira Server and Data Center

THE ULTIMATE COLLECTION OF CALCULATED CUSTOM FIELDS

BUILD BETTER JIRA SCREENS, FILTERS AND DASHBOARDS

Jira Misc Custom Fields (JMCF) lets you create new calculated custom fields to display information based on computed values. It supercharges your ability to quickly create more useful screens, enable better search and filters, and build more powerful reports and dashboards.

You can create calculations - *from simple math operations to sophisticated Groovy scripts* - based on other fields and insights available in Jira. You can also expose Jira's 'hidden' information - such as dates and authors of specific transitions or field changes - that is otherwise not easily accessible to users. For example, you can do the following:

"This is an extremely helpful plugin that makes up for a lot of capabilities that are lacking in native Jira."

- Peter Macdonald

- Display, and search by, the date and author of specific transitions;
- Calculate values based on other fields within the same issue;
- Display aggregated values of related issues;
- Display the breakdown of all issues resolved by various teams and users in pie charts;
- Report on auto-transitions (transitions that do not change the issue status);
- And so much more.
